Submitted (MAY 1995) to the EMBL/GenBank/DBDJ databases.
-i- FUNCTION: THIS PROTEIN IS INVOLVED IN THE REPAIR OF MISMATCHES
IN DAA. PLAYS A MAJOR ROLE IN MAINTAINING THE GENETIC STABILITY
OF SIMPLE SEQUENCE REPEATS AND IN THE REPAIR OF HITTERODUPLEX
SITES PRESENT IN MEIOTIC RECOMBINATION INTERMEDIATES. PROBABLY
MSH2, PMS1, AND MILHI ARE COMPONENTS OF THE SAME DNA MISMATCH
REPAIR PATHWAY.

                                                                                                                                                                                                                                                                                                    POSSESSES OTHER SUGAR TRANSPORTERS,
SUBCELLULAR LOCATION: Integral membrane protein.
INDUCTION: REPRESSED AT HIGH GLUCOSE CONCENTRATIONS.
INDUCTIONS: GLUCOSE TRANSPORT IS THOUGHT TO BE MEDIATED BY TWO
MISCELLANBOUS: GLUCOSE TRANSPORT IS THOUGHT TO BE MEDIATED BY TWO
KINETICALLY DISTINCT SYSTEMS, A GLUCOSE-REPRESSIBLE HIGH-AFFINITY
SYSTEM AND A CONSTITUTIVE LOW-AFFINITY SYSTEM.
SIMILARITY: BELONGS TO THE SUGAR TRANSPORTER FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FYSIALT 334

The nucleic acid fragment is isolated from a gene cluster containing il open reading frames (ORFs) encoding enzymes involved in denitrification. The enzymes are useful in microbial denitrification reactions, for identifying other denitrifying bacteria and for fermentation processes in absence or presence of oxygen. Chimeric genes comprising the polynucleotide of the invention can be used to alter the level of denitrifying enzyme in the recombinant host. The polynucleotide is useful for isolating genes encoding homologous proteins from other microbial species, for expression of various pathway intermediates, for expression of various pathway intermediates, for expression of various pathway intermediates, for expression of various pathway intermediates of new products, and for conferring higher growth yields on the host or for enabling alternative growth mode to be utilised. The present sequence is
                                                                                           Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon disorders such as colon cancer.
AAC97991 to AAC98763 encode the human colon cancer associated proteins called human colon cancer antigens, given in AAB53234 to AAB54006. The

The present sequence is an olfactory receptor which is encoded by one of a number of novel polynucleotides. The polynucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation secondary scents. This enables the construction of a scent representation

The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, repaid disorders, infectious diseases, and cardiovascular disorders, angental disorders, infectious diseases, and cardiovascular disorders, AAC98764 to AAC98772 and

                                                                                 AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antiinflammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antiqens. The nucleotide sequences can be used in vaccines and in diagnostic assays. The proteins and nucleotides can be useful for the detection and diagnosis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitis. AAA05591 to AAA05614 represent primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactor faculties of different individuals.
                                                                                                                                                                                                                                                                                                                         New Streptococcal protein, useful as a vaccine, for diagnosis of pneumococcal diseases and for screening agents capable of antagonizing or inhibiting expression of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

T cell epitope;
                                                                                                                                                                                                                                                           The sequences given in AAR44281-94 are peptides derived from human mp53 protein which have the ability to bind to a human Class I molecule. These peptides may be used in a diagnostic test or assay to detect human p53 protein-specific T-cells or antibodies. They may also be used in the treatment of diseases such as human cancers showing p53 protein overexpression. These peptides can bind human MHC Class I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09-DEC-1993

The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide hAM39502 is derived from human p53 and is capable of binding to the human MHC Class I allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vaccine;

This antigenic compound can be introduced into the cyroplasm of a cell by a new method where the cell is contacted with a fusion molecule comprising a delivery can be cell is contacted with a fusion molecule comprising a delivery molecule. The delivery molecule can either be a polycationic affinity handle, LEN (the protective antigen binding domain of anthrax lethal factor) or a toxin delivery molecule related to LEN. The antigenic compound is linked to either of the delivery molecules by a covalent bond. The B molety of a toxin enhances delivery of the antigenic compound into a cell. The anthrax toxin system of the invention eliminates the need to generate fusion proteins with a toxin B molety, which alleviates problems associated with incorrect folding of lengthy fusion proteins. Small cationic fusion peptides substituted for LEN may reduce the possibility of steric interference with the biological activity of the translocated protein. The method is used for the introduction of antigens, e.g. MHC class I antigens or any other therapeutic protein, e.g. toxin molecules, apoptosis-inducing molecules or signalling corrections into the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The complex is administered to prevent a mammal from having an allergic reaction to an allergic disease, or administered to a mammal having an allergic disease, to reduce the allergic reactions. Allergic diseases include asthma and skin rashes. Prior art methods or preventing/treating allergic diseases include antihistamines which treat only the symptoms, corticostercids which have severe side effects and desensitization therapy which has limited uses. The new method also allows more flexibility of use of peptide-based vaccines, as prior art HSP-based vaccines require isolation from a portion of the tumour itself. This sequence represents a peptide fragment from the P53 tumour suppressor protein which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                                                                                                                                                                                                            Heat shock protein; HSP; complex; denatured protein matrix; antige vaccine; allergic disease; treatment; susceptibility; Th2; skin ra allergic reaction; asthma; P53; tumour suppressor protein; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel method for synthesizing heat shock protein (HSP) complexes comprises adding a heat shock protein to a denatured protein matrix for binding, and adding a complexing solution comprising a peptide to elute a heat shock protein peptide complex. A HSP-antigen complex is useful as a vaccine for treating an allergic disease (in a mammal, preferably a human) to reduce susceptibility of
                                                                                                                                                                                                                                                                                                                                                                        03-SEP-1999 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY25185 standard; peptide; 35 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 1; Fig 1A; 33pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthesizing heat shock protein complexes using a denatured protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Moseley PL,

comprising a peptide to elute a heat shock protein peptide complex. A HSP-antigen complex is useful as a vaccine for treating an allergic disease (in a mammal, preferably a human) to reduce susceptibility of the Th2 response, the complex comprising a HSP-antigenic peptide complex. The complex is administered to prevent a mammal from having an allergic reaction to an allergic disease, or administered to a mammal having an allergic disease, to reduce the allergic reactions. Allergic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for synthesizing heat shock protein (HSP) complexes comprises adding a heat shock protein to a denatured protein matrix for binding, and adding a complexing solution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthesizing heat shock protein complexes using a denatured protein
                                                                                                                               flexibility of use of peptide-based vaccines, as prior art HSP-based vaccines require isolation from a portion of the tumour itself. This sequence represents a peptide fragment from the P53 tumour suppresson protein which is used in the method of the invention.
                                                                                                                                                                                                                                    include asthma and skin rashes. Prior art methods or preventing/treating allergic diseases include antihistamines which treat only the symptoms, corticosteroids which have severe side effects and desensitization therapy which has limited uses. The new method also allows more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 1; Fig 1A; 33pp; English.

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inscrive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer associated Ps, by inscriting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Addition of the

The invention provides a method for generating a hypermutable bacteria. CC The method involves introducing a polynucleotide having a dominant CC negative allele of a mismatch repair (MMR) gene under the control of an inducible transcription regulatory sequence, into a bacterium. The cell composition inducibly hypermutable. The method is useful to create desirable cutput traits for commercial applications, using dominant negative cutput traits for commercial applications, using dominant negative cutput traits. For ending proteins. The mismatch repair gene is a MUHH, MUHS, MUHL or MUHY homologue and can be selected from PMS2, MLH1, MLH3, CC MUHS, MUHL or MUHY homologue and can be selected from PMS2, MLH1, MLH3, CC PMSR or PMSR homologue. The hypermutable bacteria is useful for the control of the production, biocatalysis, bioremediation and drug discovery. It is also useful in manufacturing industry for the generation of new biochemicals cuseful for detoxifying noxious chemicals from by-products of manufacturing processes or those used as catalysts, for remediation of toxins present in the environment including polychlorobenzenes, heavy metals and other environmental hazards for which there is a need to remove them from the environment The hypermutable bacteria is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁

The bacteria are also useful for producing increased quantity or quality of protein or non-protein therapeutic molecule e.g. penicillin G. Erythromycin and Clavulanic acid, by biotransformation. Dominant negative alleles of the MMR gene are useful for producing higher quantities of recombinant polypeptides. The present sequence represents a yeast MLHI protein.
                           The present sequence represents yeast MLH1 MLH1 is a mismatch repair (MMR) gene. The specification describes a method for making a hypermutable yeast, comprising introducing a polynucleotide containing a dominant negative allele of a mismatch repair (MMR) gene, into a yeast, whereby the cell becomes hypermutable. The method is useful to create desirable output traits for commercial applications, using dominant negative alleles of mismatch repair proteins. The hypermutable yeast is useful for production, biocatalysis, bioremediation and drug discovery. It is also useful in genetic screens for the direct selection of variant subclones that exhibit new output traits. The hypermutable yeast is also useful in the manufacturing industry for the generation of the production of the direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selection direct selec

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The dengue 2 virus is an example of a member of the Flaviviridae which can be identified using the probe pair of the invention. A species-specific sequence can be amplified using the claimed oligonucleotides as primers in a PCR reaction (see AAQ12788 and AAQ12789). Other viruses which can be identified include Japanese encephalitis virus and yellow fever virus. All the dengue 2 virus proteins are encoded from an uninterrupted genomic sequence.
                                                                                                                                              Chlamydia trachomatis transport protein.

                                                                                          AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salplingitis, perihepatitis, bartholian tris; preunopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
